Early Math Learning for Talented Students

Children's brain develop from the bottom up.

Children aging 4-6 undergo a critical stage for their brain development. From infancy to their preschool years, children have gradually developed sensory processing, motor skills, emotional regulation, etc.; by the time for kindergarten, children start to develop their thinking ability.

In particular, during this period, children start to develop basic abstract ideas, sensitive to exposure to logical reasoning and spatial cognition. Therefore, age 4-6 comes the critical years for children to build core functioning for future math learning.

Math Education in the United States

In the United States, there is a jaw-dropping gap in mathematical learning starting as early as Kindergarten. While most kindergarten children are still learning counting within 10, some STEM/track-based private schools are introducing addition/subtraction within 100.

On the other hand, the mathematical education under the guidance of common core is set up so that the transition from elementary school to middle school is destined to be a rough one, with many students unable to follow through with the drastically increasing difficulty.

Therefore, early math exposure, especially for talented children will lay a foundation for their future advancement.

Young Children's Online Learning in the Post-Covid Era

2

E-learning has been a heated topic for discussion in the realm of post-secondary education for years. On the other hand, it has not been a popular choice for younger age groups, especially those in the early years of elementary school.

3

However, the coronavirus pandemic has forced students and educators across all levels of education to rapidly adapt to online learning. The impact of this — and the developments required to make it work — could permanently change how education is delivered.

A curriculum that is suitable for online learning at younger age is in need.

Introduction

1

Inspire 7 abilities in mathematical thinking

- Guide children to learn how to think
- Cultivate the ability to learn
- Nurture lifelong active learners

2

3

4

Modular Learning

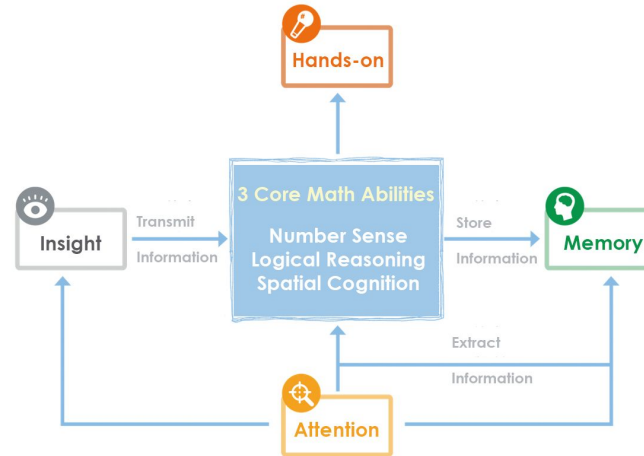

1

The curriculum dissects the process of thinking and abstracts seven core abilities required during the processes.

It includes 4 core abilities that supports universally the process of learning: **attention** (the ability to stay focused), **insight** (the ability to acquire external stimuli in an efficient manner), **memory** (the ability to process and store information), **hands-on** (the ability to coordinate cognitive processes with behavioral experiences). It also includes 3 math abilities that are critical to math learning: **number sense**, **logical reasoning**, and **spatial cognition**.

Bridge to Abstract

1

Use Evidence in **Learning Science**
to **bridge** abstract math concepts to
concrete **learning experiences**

2

3

4

Bridge to Abstract

1

Visual, Manipulatives, Gestures

Learning science and cognitive psychology has long showed the effect of visual engagement, gestural delivery, and hands-on experience in knowledge acquisition. ThinkAbility course

2

- incorporates **learning manipulatives** to help children grasp the abstract concepts
- uses **visual cues** to facilitate learning and encourage children's visual engagement with numbers
- Requires instructors to actively use **gestures**, **teaching tools** and **interactive games** to engage learners.

3

4

Engage Parents In

1

As a teacher, I want to work with parents to help children better learn.

2

As a parent, I want to know how my child is performing during the class.

3

4

Engage Parents In

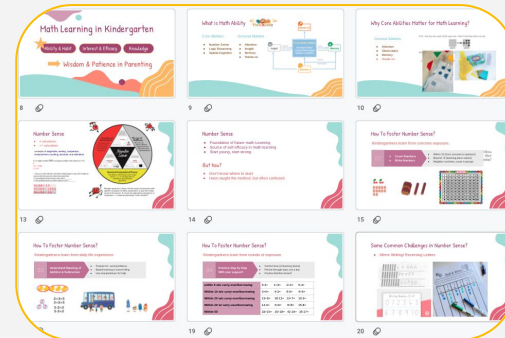

Course Info

provide detailed **lesson summary** (visual mind map, caveat notes) to both children and parents for an honest reflection of the learning outcome. Provide **additional practice** that suits the child's mastery level.

Varied Resources

provide **monthly webinar, info session, parent-meeting, and 1v1 scheduled appointments** for parents to communicate parenting knowledge, why and how to help children better learn math, individualized discussion about how to support the child to thrive.

Learning Beyond Classroom

1

BLOOM'S TAXONOMY – COGNITIVE DOMAIN (2001)

Build and Create

Apply knowledge to problem solving, e.g.

- Concept of symmetry to paper cutting
- Solid shapes to 3D creations
- Process of elimination to Sudoku Challenge

2

After every class, invite the student to be the "little professor" in explaining how to solve a new question to parents and teachers

Learning by Teaching

Iteration of Curriculum and
Instructional Design

1

2

3

4

Motivation

1

Token Economy

- Rewarding points to provide positive encouragement
- Token exchange for prizes

Gamified

- Gamified lesson design with storyline, mission, and levels.
- fun-themed course materials

Life-Related

- animations that ties back to math problems in life
- problem-solving in life

2

3

4

Engagement

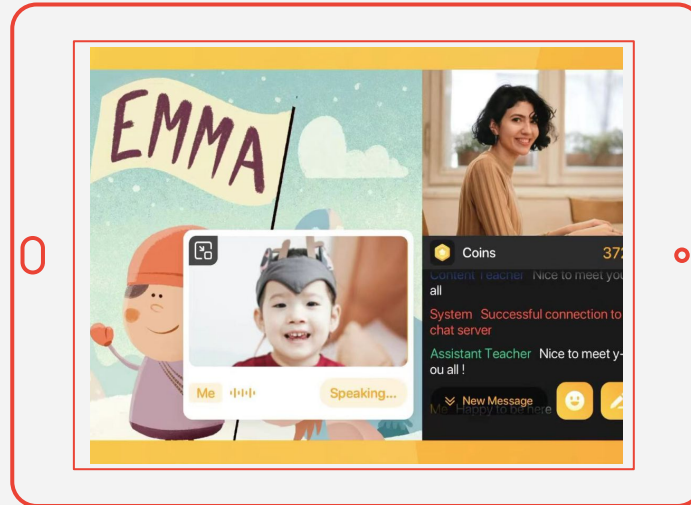

1

Functions on the interactive platforms that encourage lesson engagement.

☒ Spotlight a student to share ideas

☒ Showcase a submitted homework

☒ Raise hands to join discussion

2

3

4

Feedback

- Per semester, provides modular reports
- Review sessions and formative assessment
- Per lesson, provides parent with report on lesson completion rate, submission rate/interaction level.

1

2

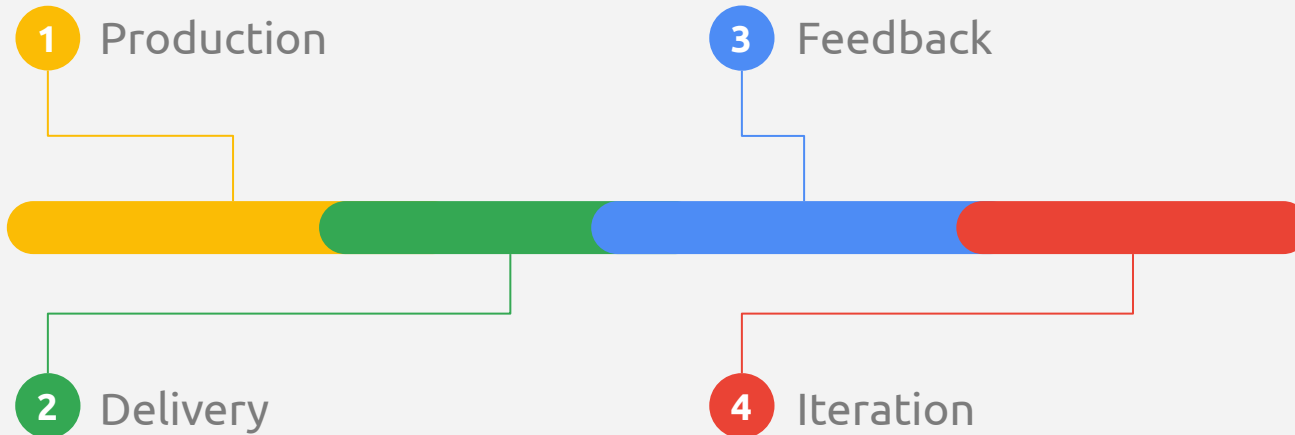

3

4

Evaluation

Collect feedback from students, parents, and instructors for iterating on curriculum and instructional design.

Thanks
